

AbuTM Fireball – User Manual

Directions to Install

- » Fix the fireball stand (bracket) in an upright position at a particular spot on the wall, close to areas prone to catch a fire
- » Fix the screws tightly ensuring the stand can withstand pressure and adequate weight of the extinguishing media (fireball)
- » Place the fireball in an upright position inside the stand (bracket). Ensure that the marking are adhered to while placing the unit (fireball)

Directions to Use

- » In the event of a fire outbreak, the fireball can come in contact with the flame. In such an instance, the outer packaging of the fireball will begin burning. This will initiate the destruction of the fireball (media) within a few seconds. The result is an explosion of the fireball, which would liberate the extinguishing powder spread across the entire section of the burning materials within the vicinity of the flame.
- » However, in case a fire breaks out near the fireball (media). Pick up the unit and throw in the direction of the flame. Users are advised to note that the unit can only be utilized on fires occurring on horizontal surfaces.
- » The user must throw the unit from a distance of atleast 2 meters from the point of flame.
- » The flame will eventually begin burning the outer packaging of the media. This will initiate the activation of the unit thereby causing a minor explosion, which would spread all the ingredients in the surrounding areas, specially suppressing the fires causing it to extinguish immediately.
- » The unit can be used by minors, who have undergone training and are capable enough to understand the directions mentioned in the user manual.
